

Solution Architecture

Date	30 September 2026
Team ID	SWTID-2026-8026
Project Name	Import Data Using Transform Maps (Spreadsheet)
Maximum Marks	5 Marks

Solution Architecture Diagram:

This is a high-level view of our solution's architecture. It shows the Presentation Layer, the Application Layer (auth, core logic and external integrations) and the Data Layer used to import spreadsheet data with transform maps.

Component Description Table

Component Name	Description / Role in Architecture	Technologies Used
Presentation Layer	What the admin sees and uses: pages to upload a file, create the data source, set up the transform map and view the import log.	ServiceNow Next Experience UI
API Gateway / Web Layer	Receives the requests from the browser, handles the file upload and passes it on to the platform services.	ServiceNow instance web server, REST Table API
Auth Service	Checks the login and decides who can upload files, create transform maps or only view records.	ServiceNow login, roles, ACLs
Core Logic Service	Loads the spreadsheet rows into the import set, runs the transform map, applies field scripts and the coalesce field.	Import Sets, Transform Maps, Glide API scripts
External Integrations	Takes the Excel / CSV file as the data source and sends an email when the import is done.	Excel / CSV files, ServiceNow email notifications
Database	Stores the staging rows, the final records and the log of skipped or failed rows.	ServiceNow platform database (import set, target tables)
